## Plantar wart removal images

Adult Skin Issues Copyright 2007 Interactive Medical Media LLC Plantar Warts are warts that occur on the soles or soles of the feet. Regular activities, such as standing and walking, tend to cause calus, which protects warts and makes treatment more difficult. The increased pressure from the call can make the foot very painful. Like all warts, they are harmless and can disappear without treatment. But often they are too painful to ignore and need treatment. Determining how to treat plantar warts can depend on the ability to tolerate the pain that various treatments can cause. The calus can be soaked and treated with water to soften the calus and put it down with a file of pebbles or claws. Folk remedies for treating warts are plentiful, and there is no single treatment that works every time. Conventional treatments focus on removal, and alternative approaches gradually emphasize remission. Whatever you do, don't try to cut off plantar warts yourself, as they can cause injuries or infections on your own. Plantar warts that grow together in clusters are called mosaic warts. Learn more about plantar warts. Slideshow: Slideshow: General Foot Problems Photo Article: Understanding Basal Warts - Understanding Basic Articles - Treatment Articles: Understanding Basal Warts - Symptoms Source: Copyright 2007 Interactive Medical Media LLC Text: Understanding Sole Warts - Basics, WebMD Medical Reference, Understanding Basic Warts - Treatment © All rights reserved. 52511 34 Information for adult children's teen captions goes here. Warts are the growth of skin and mucous membranes (mouth or genitals) caused by more than 100 types of human papillomavirus (HPV). The virus causes thickening of the top skin layer. Plantar warts occur in the soles of the feet. It can look and feel like a kars. Plantar warts are small and can grow to cover most of the soles of the feet. They are usually painless, sometimes taking months to resolve (but can take two years) and going away on their own. Warts are usually acquired from person-to-person contact. The virus is not very contagious, but it can cause infection by entering through a small break in the skin. Similarly, warts can spread elsewhere in their bodies. The virus is rarely transmitted by touching objects used by the infected person. Warts can affect people of all ages, but are most common at 12-16 years of age. It is estimated that 20% of schoolchildren and about 10% of the general population have warts. People who have HIV or organ transplants or chemotherapy have a higher incidence of warts because of their weak immune system. The most common places for plantar warts are: the soles of the feet of the feet, especially the areas that support the weight (e.g., the heels and balls of the feet) The lower plantar warts of the feet can occur aloneUsed in clusters. They appear as thick, rough, kars-like thicknesses on the soles of the feet. In addition, plantar warts often have multiple small black dots on the surface, which are actually small blood vessels. Plantar warts are usually soft. Infection with plantar warts can be described as: small plantar warts - one or few small, painless lesions Moderate plantar warts - multiple lesions, huge plantar warts - the buds cover most of the sole and can cause significant discomfort and pain. In addition, treating warts does not always destroy them, it is necessary not to necessarily show other warts. Treatment is painful, causes scars and may need to be repeated, so it should only be done if warts are very troublesome or interfere with daily life. Duct tape applied daily to the affected area seems to work for unknown reasons. The tape is very sticky and should be held for several days. During duct tape changes, warts should be soaked in lukewarm water, and any loose skin should be removed every few days, with mild abrasives such as pebbles and emery boards. Commercial wart removers have a high percentage of salicylic acid and work by dissolving layers of skin infected with the virus. This treatment should be used daily and can be irritating if you touch unaffected skin. The 40% salicylic acid selfie stick pad seems to be one of the most effective types. Cut off the pad covering the wart and duct tape over the pad to secure it. Continue for 2-3 days. Remove the pads and tape and scrape off the top layer of dead skin, with an emery board or pebbles. Re-apply the new 40% salicylic acid pad and duct tape. Remove the dead skin and continue to re-apply every few days until the warts are gone. Many plantar warts react in 1-2 months. Over-the-counter cryotics are available, but have not been found to be very effective. Families should not share their personal information, such as towels. If you have, make an appointment with a dermatologist or another doctor: painful or bleeding warts. Spread or multiply the warts rapidly. Warts that interfere with daily life and do not respond to self-care. People with diabetes or cardiovascular disease should have warts treated by a doctor. Once diagnosed with plantar warts, the doctor can try one or more of the following treatments: using a freezing (cryo-surgery) electric needle (electric cordery) with liquid nitrogen, using a laser to interfere with the blood supply of cantalidine, podophyrin, tretinoin, or candida allergic, a protein that causes allergies, or injections with slippemia. You can be very stubborn with plantar warts directly into warts and effective treatment can take many months.
